

Reduce Overproduction!

Georg-Wilhelm Geckler

Hamelin, Germany

November 5, 2020

Message prepared for the 17th Workshop on Transforming Humiliation and Violent Conflict at Columbia University in New York City, December 10 – 11, 2020. Due to the coronavirus pandemic, this conference had to take place online.

See www.humiliationstudies.org/whoweare/annualmeeting/35.php

We live in a time of massive overproduction due to excessive consumption by people who can afford it. This overproduction creates a lot of superfluous, unnecessary, even harmful products, tons of waste, greenhouse gases, and, for thermodynamic reasons, thermal energy that can no longer be used but is also called waste heat. In addition, a lot of electricity is consumed that has to be generated, as well as raw materials that must be obtained, processed and transported. We also live at the expense of poor people who are exploited and oppressed to the last during the production processes and have no chance of improvement, as well as at the expense of nature, environment, and the climate.

Is it possible to only approve those products for manufacture and trade that have passed an approved sustainability test?

I think that would help to solve many problems of today including climate warming and contaminating land and water with plastic rubbish.
